

DECAY GLOSSARY

All terminology in this document is applicable to chat and document communications. It does NOT denote variable naming necessarily, nor in game dialogue and art.

Use this as a way to communicate with ELISE about the game or to clarify text within the document.

DECAY

1. The name of the game and project
2. the process that causes a dice to be unavailable until the current game is over, removes the dice instance from the board while playing the designated animation, and breaks the slot beneath that dice.
3. The Label on the Hourglass during the reposition phase, which designates to the player what will happen when they push it -that being the decay process.

DICE

An in game object that represents a dice. By default this has 6 faces with values 1- 6 on these faces. Each dice face has a roll value. Dice faces also have score values separate from their roll value. Dice may also have a general score value that applies to all faces on the dice. Dice can have effects. Dice faces can be altered.

SLOT

A position on the board where a dice is placed. Each side has 6 opposing slots and can only place dice in the slot designated for their side. A slot can be unbroken, unstable, or broken. Slots all become unbroken when a game ends. Slots are labeled 1E 2E 3E 4E 5E 6E for enemy and 1P 2P 3P 4P 5P 6P for player. Slots process in order from 1 to 6, and a slot with the same value for enemy and player will process at the same time: ie, slot 1E and 1P, then slot 2E and 2P.

ROLL

1. The label on the hourglass during the setup phase that designates to the player what will happen when it is pushed -that being rolling the dice.
2. The process of all dice in board slots selecting a random face, playing the roll animation, and then ending on the correct sprite for the selected face.

BOARD

The area in the scene where the dice slots and slot labels exist. The board can have dice dropped into its slots from the inventory, or populated to its slots by the enemy.

ENEMY

The name for the AI opposing the player in the battle.

PLAYER

The name for the one controlling the interface during the battle

ROLL VALUE

A value between 1 and 6 that is used for the DECAY PROCESS and corresponds to a dice face

SCORE VALUE

A value assigned either to a dice or a dice face. By default a dice has a score value of 0 and each dice face has a score value equal to its roll value. This value can be altered within a battle temporarily. A dice's score value and its face's score_value are separate but both are added to the score when the dices score is processed.

FACE

One of the states a dice can have that refers to a specific roll value and sprite -if a dice has score value associated with a specific face it also refers to this.

OPPOSING

Used to denote two slots with the same numeric value across from each other. I.e. 1E and 1P are opposing. 1E and 2P are not opposing.

SIDE

A set of slots belonging to exclusively the player or the enemy. I.e. 1E 2E 3E 4E 5E 6E is a side. The terms Players side and Enemies side are common.

BROKEN

The state of a slot after a dice inside of it has decayed or after an unstable slot is finished scoring. A slot that is broken displays the appropriate sprite and cannot have any dice placed into it until the game is over. If all slots are broken on either side the game is over automatically after the scoring process is done.

UNSTABLE

The state of a slot after a dice inside it has been SAVED. The slot becomes unstable, and after the score process ends it breaks. The dice in this slot is not disabled for the remainder of the game, and is not reset. Instead, it goes back to the battle inventory.

UNBROKEN

The state of a slot where a dice can be placed into it and that dice will score, roll and can be swapped during the reposition and setup phase

RESET

When the accumulated states, values, and data of a version of an object are changed back to their initial state. With dice this means the state recorded inside the global inventory. With objects this means whatever state is designated by their behavior

SWAP

When two objects (dice) exchange positions on the board. I.e. dice A in 1E swaps with the dice B in 3E. After the swap dice B is in 1E and dice A is in 3E. Dice cannot swap with opposing sides dice. Dice can swap with inventory dice if the battle is in the setup phase.

SETUP

The initial phase of each round. During this phase the hourglass displays ROLL, and the slots on the board are available to have dice added to them if they are not broken. This phase happens after scoring and denotes the beginning of a round.

REPOSITION

The phase after the dice have been rolled. The hourglass displays DECAY. Dice can be swapped between their sides slots but cannot be swapped into the inventory. When the hourglass is selected again it begins the decay, then the scoring process before finally returning the battle to the setup phase

PROCESS

The term for a series of actions performed in a specific order that are shown to the player visibly. The DECAY process and the SCORE process are the main two, but the INVENTORY MOVEMENT process and others will be added. The Decay process always happens before the Score process.

DECAY PROCESS

The series of resolutions from slot 1 to 6 in order that check for roll values of 1 and 6, and act accordingly to the decay rules.

SCORE PROCESS

The process of dice adding their score value to the ABACUS in order from 1 to 6, score value is separate for enemy and player sides.

EFFECT

A specific action that a dice performs when it is processed that alters the score value, decay, save or other aspects of DECAY. These are dice specific and not available during the tutorial

CHARM

An addition that causes a effect, but this effect is enabled the entire battle.

HOURGLASS

The in game object that designates round phase changes and can be clicked by the player to start these.

ABACUS

The in game object that record the player and enemy scores

DRAWER

The in-game visual interface that holds the player's currently available Battle Inventory dice that can be interacted with and placed on the board during the Setup Phase. It also displays information about selected dice.

ROUND COUNTER

The in game object shown as a yellow hand that displays what round is active

BATTLE

A series of 2 games.

GAME

A series of 4 rounds.

RESOLVED

A state meaning an object or slot has completed all actions and rule checks required of it during the current process, and its result is final for that process. Once resolved, later objects or slots cannot change that result unless a rule specifically says otherwise.

ROUND

One process of setup phase, roll, reposition phase, decay process, score process, and a reset.

ROUND SCORE

The score value of a sides dice after the decay process has resolved all added together. This is added to the total score

TOTAL SCORE

The score displayed on the abacus that persists between rounds and games. The total of all of a sides round scores.

BATTLE INVENTORY

The collection of dice available to one side during a battle. Dice can be moved from here to the board during the setup phase . this inventory is populated at the start of the battle, and contains the battle-specific versions of dice, including any temporary changes made during play. If a dice is decayed then its battle inventory information resets and it should be repopulated from the global inventory.Changes made to dice in the Battle Inventory do not alter the Global Inventory

unless specifically stated.

GLOBAL INVENTORY

The source of truth for dice data, including faces, roll values, effects, and score values. This is not edited by battle changes to these values unless this is specifically denoted. If a dice decays then its data is repopulated from this inventory after the game is over rather than from the in battle data.

SELECT

The action of choosing an interactable object as the player's current focus. A selected object may display selection feedback or allow actions associated with selection.

DESELECT

The action of removing the current selection from an object. After being deselected, the object is no longer the player's current focus.

*Use **unselected** when describing the state itself.*

AVAILABLE

A gameplay state meaning a dice or interactable object is currently allowed to receive the player interactions permitted by the current phase. Availability does not describe whether a slot is broken or whether an object is selected.

UNAVAILABLE

A gameplay state meaning a dice or interactable object currently cannot receive player interaction. It may still exist visibly and participate in game processes.

PROCESSING

A temporary state meaning an object is currently being handled by a game process and cannot be interacted with by the player until that processing is complete.

WILLDECAY

A dice with a roll value of 6. It is a source of decay and will itself decay during the Decay Process unless it is successfully saved.

TARGETED

A dice opposing a WILLDECAY dice. A targeted dice is threatened with decay from that opposing 6 unless it is successfully saved. Being targeted does not mean decay has already occurred.

DECAYED

A dice whose decay has completed. It is removed from the board, becomes unavailable for the remainder of the current game, and causes its slot to become broken.

SAVE

The action of preventing one eligible dice from decaying. A save becomes available when a dice with a roll value of 1 is processed during the Decay Process. It can only protect an eligible dice in a later slot on the same side.

WILLSAVE

A dice with a roll value of 1 that has already been processed during the Decay Process and has an unused save available. It will protect the first eligible later dice on its own side that would otherwise decay.

SAVIOR

A 1 that has already used its willsave to protect another dice. Its save has been consumed and it cannot save another dice that round.

PROTECTED

A descriptive term for a dice whose pending decay is currently being prevented by a save. This describes what the save is doing to the dice, rather than a separate long-term state.

SAVED

A dice that would have decayed during the current Decay Process but was successfully protected by a save. A saved dice is allowed to score, while its slot becomes unstable and breaks after scoring.
